SKILLS

Consultancy
Agile Management
Project Planning
Risk Assessment
Adaptability
Machine Learning
Full-stack development
Data Analysis
Problem Solving

TECHNICAL SKILLS

C# & ASP.NET
Node.js & React.js
HTML & CSS
JavaScript & TypeScript
Playwright & Postman
SQL
CI/CD
Python
Pandas & Matplotlib
Scikit-learn & TensorFlow
AWS Cloud Practitioner
Tableau & Power BI
Office Suite & GIT

SUMMARY

Software developer with Russell group university degrees in engineering, a Level 4 Software Development apprenticeship, a Data Science diploma, and AWS Cloud Practitioner certification. Proficient in .NET/C# and React/TypeScript for full-stack development, as well as Python and SQL for data analysis and machine learning. Skilled at planning, building, testing, deploying, and maintaining clean and reliable software systems. Driven by building scalable, data-driven solutions and solving complex problems that deliver measurable business value.

PROFESSIONAL EXPERIENCE

Junior Software Developer

May 24 - Present

Dorset Software – Oxford, UK

Dorset Software specializes in custom software development and IT consultancy, offering services such as system integration and application development across various industries, including healthcare, government and finance.

- Worked across multiple client projects in insurance, IoT, and large-scale web platforms, delivering full-stack features, automated tests, and data-engineering solutions.
- Contributed to front-end development with Next.js/React, back-end development using SQL, ASP.NET, REST APIs (Entity framework).
- Automated testing using Vitest/Jest, Playwright, Postman, and CI/CD.
- Completed an 18-month Level 4 Software Developer Apprenticeship, gaining strong grounding in SDLC, Agile delivery, and modern engineering practices.
- Use of Agile management, Azure DevOps, AWS, and many other tools.

Data Science Intern

July 23 – April 24

Pictet Asset Management - Geneva, Switzerland

Pictet Asset Management is a financial institution offering investment solutions with equities, fixed income, alternative and multi-asset products, and services.

- Assisting the *multi-asset solutions* team, as a member of the AI Analytics team, in calculating and analysing the different types of trading costs, from broker commission to market impact costs. Gathered internal data from in premises and cloud databases, as well as market data from external providers to create impactful tools and solutions for portfolio managers.
- Created a dynamic Tableau dashboard summarizing trading cost history with various benchmark for data visualization and performance review. Developed an automated pdf report based on the dashboard with Prefect, sent to portfolio managers on a weekly basis.
- Developed a Python library for easy data querying, visualization, and analysis.
- To enhance the accuracy of our trading instruction strategy, I trained a machine learning classification model. I utilized the Google BERT NLP model to encode comments from portfolio managers.
- Use of Python, SQL, Snowflake, AWS S3 and Tableau.

JULIEN BENICHO

LANGUAGE

French - Native
English - Fluent

INTEREST

Volleyball – Currently
playing for the Oxford
Volleyball Club
Tennis – Competitive level

VISA STATUS

EU Citizen – French
EU Settled Status w/ right
to work in the UK

HIGH SCHOOL QUALIFICATION

Baccalauréat scientifique
Physics and Chemistry major
15.15/20 - « Mention bien »
(graduated with high honours)
Lycée Condorcet - Paris, France

EDUCATION

Level 4 Software Developer Apprenticeship - Merit May 24 – Feb 26
Dorset Software, UK

Full-Stack Development, Software Development Life Cycle (SDLC), Data Engineering, DevOps competencies.

Work Based Project – Iot system sending messages to displays using a web UI:
Tested a wireless e-paper desk-display system, including a UI for device registration and employee check-ins. Led test planning and test automation for an ASP.NET/React.js application within an Agile workflow. Built CI/CD pipelines for unit, integration, and end-to-end tests and supported deployments to staging and production.

Data Science Diploma Oct 22 – Feb 23
Mines de Paris – Université PSL, France

Data visualisation, Machine Learning, Deep Learning, Data engineering. Use of Python and SQL with ML and Data libraries.

Course project - Speech to Text Application Programming Interface: Developed a speech-to-text system in a team of 3 for connected glasses to assist deaf and hard-of-hearing users, trained and validated using the LibriSpeech corpus. Processed raw audio into spectrograms and built a convolutional neural network using Python and deep-learning libraries (NumPy, Matplotlib, Seaborn, Scikit-learn, TensorFlow).

MSc Engineering with Management - Merit Sep 2021 – Sep 22
King's College London, UK

Machine Learning and Brain-inspired computing/hardware design, Robotic systems, Security engineering, Nature-inspired algorithms, Operation and Project management.

Master's thesis - Low-cost Device Implementation to perform Odour Detection:
Built a cost-effective odour-detection system using a pH-sensitive sensor controlled by Arduino, converting chemical responses into digital signals. Developed a microfluidic pump to automate reactions, with real-time pH visualisation through a Python interface. Demonstrated accurate flow-rate control and pH measurement, delivering an affordable platform for broader odour-classification applications.

MEng Electrical and Electronics Engineering – 2.1 Sep 17 – Jun 21
University of Bristol, UK

Engineering maths, Programming, Control systems, Electronics and Power electronics, Fields and devices, Communication systems, Video and Audio coding, Energy management, Networking Protocols, Optoelectronics.

Master's thesis - Force free Wireless Power Transfer: Designed a wireless power-transfer system for an IoT sensor, ensuring efficient energy delivery with no mechanical contact between transmitter and receiver. Computed coil inductances in MATLAB and modelled both transmitter and receiver circuits in LTspice. Achieved 117.3mW transferred at ~10cm (coupling factor 0.0139) using a Rezence-standard operating frequency.

Bachelor's final year project - Rubik's Cube solver: Built a Rubik's Cube-solving robot in a team of five, integrating stepper motors and designing their control circuits. Developed the main circuitry, including a band-pass filter and PWM generator for audio-based data transmission, and produced a compact PCB for the final system. The robot used one motor per cube face, controlled by custom software and guided by a webcam-based colour-recognition system.
